

08 DEC 1997
Ref: 98-F-0128

Ms. Katrina Worsley
Oracle Government
196 Van Buren Street
Herndon, VA 20170

Dear Ms. Worsley:

This letter responds to your October 16, 1997, Freedom of Information Act (FOIA) request.

The enclosed documents are provided as responsive to your request. There are no chargeable costs for processing your FOIA request in this instance.

Sincerely,

"Signed"

A. H. Passarella
Director
Freedom of Information
and Security Review

Enclosures:
As stated

PERSONNEL DIRECTORY CHANGES

Date of Request: _____

From: _____

Please provide changes to the Personnel Directory on this form to Management Operations (DMO), Room 1E 118. Do not call in changes.

Only show changes to the organizational portion of the directory because the alphabetical portion will be updated from that information.

Personnel who have not processed into BMDO through Management Operations (DMO) are not in the current directory.

THE BALLISTIC MISSILE DEFENSE ORGANIZATION

INTRODUCTION

Although conceived at the height of Cold War tensions, the Ballistic Missile Defense Organization (BMDO) is now structured to respond to the current theater missile threat and an evolving threat to the United States. The Department of Defense therefore relies on the BMDO to develop and deploy active defenses against ballistic missile attacks and to create a technology base that will allow US forces to hedge against advanced missile threats.

The BMDO pursues three main objective areas: theater missile defense, national missile defense deployment readiness, and advanced technology research and development. The BMDO manages several programs to meet these three objectives and operates a number of other programs to guarantee an integrated, effective, and coherent response to continuing worldwide missile proliferation.

Ballistic Missile Defense Organization

THE DIRECTOR AND THE EXECUTIVE STAFF

The Under Secretary of Defense for Acquisition and Technology is responsible for providing oversight and guidance for the ballistic missile defense (BMD) acquisition program while the day-to-day leadership and management falls on the Director, BMDO. The Director serves as the principal advisor for the conduct of the BMD program. This involves defining the BMD program vision, goals and objectives, setting priorities, assigning responsibility, and managing program resources to achieve approved program objectives. The BMDO Deputy Director and Chief of Staff support the Director in these activities. The Chief Architect / Engineer serves as the principal advisor for the design and implementation of the various architectural disciplines and new initiatives leading to acquisition milestone decisions of the agency's BMD programs. The Chief of Staff provides executive assistance to the Director and

Deputy Director and ensures agency coordination and communication.

The General Counsel provides legal advice to the Director and represents the BMDO in all legal matters, including international law and treaties involving the BMD Program, such as arms control treaties.

The Director also establishes the various organizational elements of the BMDO, according to resources authorized by the Secretary of Defense. Additionally, the Director is the BMD Acquisition Executive and chairs the BMD Acquisition Review Council (BMDARC). The Service Acquisition Executives, the Service Vice Chiefs of Staff, and the Vice Chairman of the Joint Chiefs of Staff comprise the BMDARC.

THE DEPUTATES

There are four BMDO deputates that operate under the umbrella of the Director's office. The deputates are: the Deputy for Strategic Relations; the Deputy for Program Operations; the Deputy for Theater Air and Missile Defense; and the Deputy for Technical Operations.

The Deputy for Strategic Relations develops the analysis, planning, and implementation for all strategic relations of the organization. The Deputy for Strategic Relations is the principal advisor to the Director for international participation in the BMD Program and for relations with other government agencies. Additionally, Strategic Relations handles congressional, media and public relations on strategic planning issues and inquiries. Finally, Strategic Relations coordinates policy and programs regarding international security, arms control negotiations and international agreements.

The Deputy for Program Operations is the principal advisor for planning and control, cost estimating and analysis, financial management, information

management, and independent reviews and audits of BMDO projects and operations. Program Operations collects and assesses financial and programmatic data and is the focal point for performance management and measurement activities. Furthermore, the Program Operations Deputate works closely with the Office of the Secretary of Defense and the individual services to produce the BMDO budget and the BMDO Program Objective Memorandum.

The Deputy for Theater Air and Missile Defense oversees all DoD BMD acquisition, namely theater missile defense (TMD) programs and systems. It also manages TMD acquisition programs, TMD research, development & acquisition and advises the Director on TMD issues. The Theater Air and Missile Defense Deputate, the Technical Operations Deputate, and the Services all work together to jointly develop and deploy BMD systems.

The Deputy for Technical Operations oversees ballistic missile defense technology and Technical Service support programs. This primarily involves managing BMD technologies to meet near-term commitments and long-term needs for future defensive systems and advising the Director, BMDO on BMD technology policy, resource allocation, and program priorities. In addition, the Deputy for Technical Operations manages technical activities (modelling and simulation, network development, environmental issues, civil engineering, and test resources) that support both TMD and NMD mission areas.

THE SUPPORT DIRECTORATES

There are four main support directorates. The support directorates are similar to the deputates, but are administratively closer to the Office of the Director. They are: Small & Disadvantaged Business; Contracts; Management Operations; and Security, Intelligence, and Countermeasures.

FIELD OFFICES

There are two field offices: the National Missile Defense (NMD) Joint Program Office (JPO) in Washington, DC, and the Joint National Test Facility (JNTF) located at Falcon AFB, CO. The NMD JPO is responsible for developing and maintaining options to deploy a cost and operationally effective NMD system, should a decision be made to deploy such a system in the future; and developing and coordinating plans for deployment readiness in order to reduce lead-time and costs for an NMD deployment. The JNTF provides missile defense related analysis, system level engineering, integration and test and evaluation support for the development, acquisition, and deployment of missile defense systems and architectures.

The various components of the BMDO work together with the Services and with the Secretary of Defense to make missile defense a reality and to improve the United States' military and economic security.

BALLISTIC MISSILE DEFENSE - THE CORE PROGRAMS

INTRODUCTION

The Ballistic Missile Defense Organization (BMDO) Core Programs consists of those systems that have been selected to form the bedrock of the theater ballistic missile defense (TBMD) architecture. The four core programs are PATRIOT Advanced Capability-3 (PAC-3), Navy Area TBMD, Theater High Altitude Area Defense (THAAD), and Navy Theater Wide systems. These four core TMD programs represent the bulk of BMDO's research, development, test & evaluation (RDT&E) and procurement budget for Fiscal Year 1997. The variety of scenarios and threat characteristics (maximum/minimum ranges, reentry vehicles, radar cross sections, etc.) and the characteristics of the defended areas (military forces, population centers, ports of debarkation, etc.) require complementary systems for complete and cost-effective defense. Therefore, BMDO is developing the core systems which will begin deployment by the end of this decade and will greatly improve U.S. defense capabilities against the existing theater ballistic missile threat.

PATRIOT ADVANCED CAPABILITIES - 3

PAC-3 is the most recent version of the famous PATRIOT system that was so prominent during the Gulf War. By 1999, the PAC-3 system will be completely upgraded to defend the lower tier of the ballistic missile defense (BMD) architecture. This mission will include defending troops and fixed assets from short and medium range ballistic missiles, cruise missiles, and other air breathing threats such as fixed or rotary wing aircraft. The PAC-3 is designed to be easily deployed anywhere in the world and can be transported aboard C-141 or C-5 aircraft.

PAC-3 system development consists of three increasingly sophisticated upgrades called configurations. During 1995 and 1996, the two initial configurations were

PATRIOT Advanced Capabilities - 3

PAC-3 Missile

Hit-to-Kill, single stage interceptor destroys targets in endoatmospheric (in the atmosphere) interceptions

Radar Set

Target detection, tracking and discrimination

Provides uplink communications to in-flight PAC-3 interceptors

Engagement Control Station

Provides command, control and communications and fire control for PAC-3. Links PAC-3 to other force elements

PAC-3 Launcher

Protects and launches PAC-3 missiles. Canister provides easy reloading of up to 16 missiles

deployed to provide a missile defense to our troops as quickly as possible. In 1999 the final PAC-3 upgrade, configuration 3 will reach the field.

The final PAC-3 configuration will field improvements to virtually all system components. Upgrades to the ground radar will improve its multifunction and low altitude capabilities, threat detection, and threat discrimination. The new PAC-3 missile will destroy targets by ramming them while they are inside the Earth's atmosphere -- a process called endoatmospheric hit-to-kill interception. Other improvements include better command, control, and communications, and greater interoperability.

The PAC-3 Fire Unit has three main components: the ground radar set, the Engagement Control Station, and eight missile launchers.

NAVY AREA TBMD

The Navy Area TBMD system is based on the Navy's AEGIS cruisers (Ticonderoga class) and destroyers (Arleigh Burke class), which form the backbone of the U.S. fleet. With relatively minor modifications, these ships can be adapted to the ballistic missile defense role. The changes include upgrading the ships' AN/SPY-1 radar and AEGIS Combat System computers, as well as the computer programs. The STANDARD Missile (SM-2) Block IV will also be modified to optimize its performance against both cruise and ballistic missiles, including the addition of an infrared seeker to improve intercept accuracy. These improvements will provide theater commanders with a defensive capability against short and medium range theater ballistic missiles (TBMs) in the atmosphere during their descent phase. These ships will not need additional personnel to take on this mission, and the Navy already has the infrastructure in place for training and logistics.

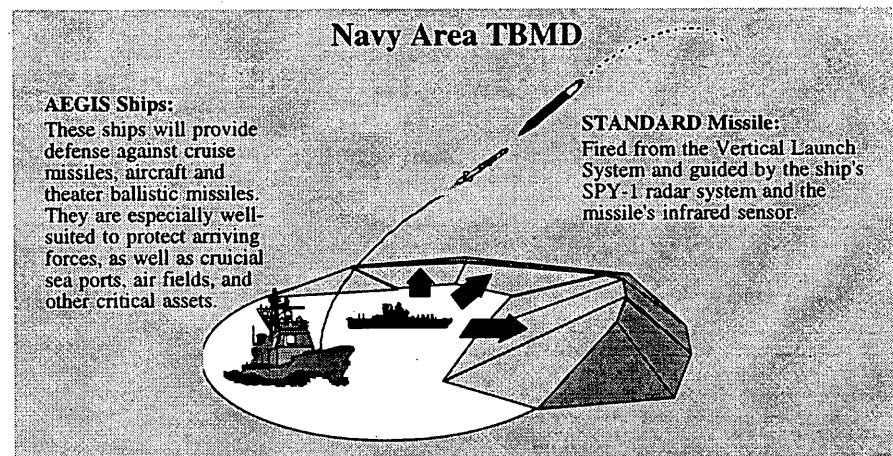

Sea-based TMD offers several advantages to the nation. They can be stationed offshore near potential crisis "hot spots" where land-based TMD forces could not be readily deployed. As ships equipped with the Navy Area TBMD system can operate in international waters, there is no requirement to secure approval from a foreign government for deployment of the system. Ship-based TMD systems can also greatly reduce the demands placed on airlift and sealift assets.

BMDO and the Navy plan to field a UOES system for continued testing and training, as well as an emergency warfighting capability, upon successful completion of the User Operational Evaluation System testing in Fiscal Year 2000. The Navy will receive its First Unit Equipped (FUE) with production software, hardware modifications, and SM-2 Block IV A missiles in 2002.

THEATER HIGH ALTITUDE AREA DEFENSE

The THAAD system provides a ground-based, upper-tier component to the TMD architecture. THAAD engages TBMs at higher altitudes and longer ranges than lower tier systems, supporting both exo- and endo-atmospheric hit-to-kill engagements. THAAD's range provides it sufficient battlespace, under most scenarios, to engage a threat, assess the success of the engagement, and, if necessary, fire a second missile. THAAD can engage nearly all elements of the TBM threat spectrum. THAAD represents a key element of the TMD architecture's ability to intercept incoming TBMs at a distance, thereby minimizing the effects of weapons of mass destruction on the ground and otherwise preventing post-intercept debris from falling on our troops.

Development of the THAAD system started in 1992 and will be fielded by the Army in the 2006 time frame. The THAAD acquisition strategy includes provision of the User Operational Evaluation System - a development prototype that provides input into the design process and serves as a contingency capability in the event of a national emergency. THAAD is comprised of the ground-based, X-band radar, THAAD

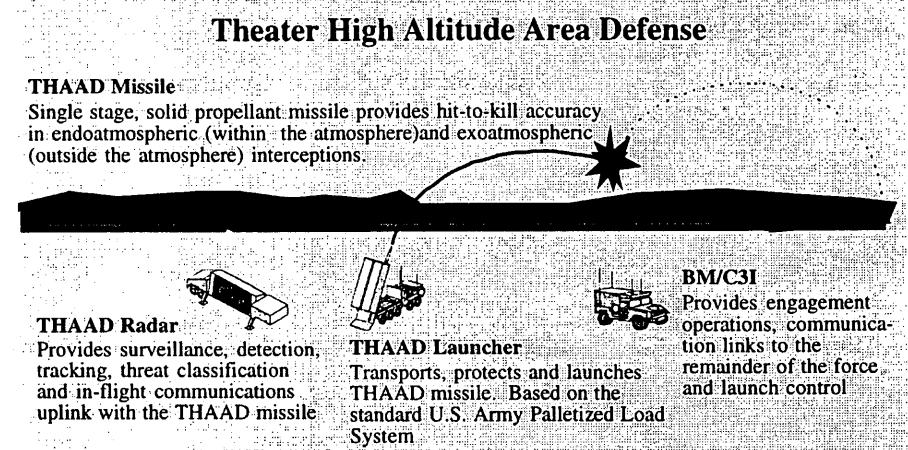

launcher, THAAD missile (booster and kill vehicle), and battle management/command, control, communications, and intelligence (BM/C3I) segments.

NAVY THEATER WIDE

In 1996 the Navy Theater Wide (NTW) program was made part of the "core" TMD program. NTW was also designated a pre-Major Defense Acquisition Program (pre-MDAP), a program that may eventually become an MDAP.

Like the Navy Area Ballistic Missile Defense program, NTW continues to build upon modification to AEGIS ships and the STANDARD missile. The NTW system will modify the STANDARD missile for ascent, midcourse, and descent phase exo-atmospheric intercepts. The AEGIS Weapon System will be modified to support the increased battle space required for the improved, longer-range interceptor.

In late 1997, NTW will conduct its first flight under the flight demonstration program. This flight test will use a STANDARD Missile-2 Block IV and help in the understanding of the performance of the STANDARD missile autopilot at high altitudes. In addition, the BMDO-Navy team will continue engineering and ground-test activities to support the first controlled test vehicle flight test in Fiscal Year 1999, as well as continuing risk reduction activities. The first STANDARD Missile-3 intercept flight is scheduled for Fiscal Year 2000.

BMDO FACT SHEET 97-06

HISTORY OF THE BALLISTIC MISSILE DEFENSE ORGANIZATION

INTRODUCTION

Tonight, consistent with our obligations under the ABM Treaty and recognizing the need for close consultation with our allies, I am taking an important first step. I am directing a comprehensive and intensive effort to define a long-term research and development program to begin to achieve our ultimate goal of eliminating the threat posed by strategic nuclear missiles... Our only purpose - one all people share - is to search for ways to reduce the danger of nuclear war.

- President Ronald Reagan, March 23, 1983

The Ballistic Missile Defense Organization (BMDO) traces its roots to the Strategic Defense Initiative (SDI) program that President Ronald Reagan started in March 1983. SDI sought to find an alternative to the doctrine of mutual assured destruction, which relied on the threat of massive nuclear retaliation to deter Soviet actions that might lead to nuclear war. After a year of studies and preparation, Secretary of Defense Caspar Weinberger chartered the Strategic Defense Initiative Organization (SDIO) in April 1984.

In May 1993, the Department of Defense changed SDIO to BMDO in recognition of the radically altered international security environment. This change signified a reorientation of ballistic missile defense policy to place primary emphasis on developing and fielding advanced theater missile defenses.

ACHIEVEMENTS

The SDIO program produced several significant technological advancements. In 1984 the Army's Homing Overlay Experiment demonstrated the feasibility of intercepting a reentry vehicle in mid-course with a hit-to-kill interceptor. Building on the Army's success, SDIO carried out a number of successful hit-to-kill experiments: the small radar homing interceptor technology base, SDIO's Flexible Lightweight Agile Guidance Experiment (FLAGE) and Exoatmospheric Reentry Vehicle Interceptor System (ERIS). These programs advanced kinetic kill technology to the point where it was proven to be cost effective and reliable and was judged to have the best performance against weapons of mass destruction.

HERALDRY OF THE STRATEGIC DEFENSE INITIATIVE ORGANIZATION AND THE BALLISTIC MISSILE DEFENSE ORGANIZATION

The symbol of the original Strategic Defense Initiative Organization (SDIO) was a defensive shield and five stars representing the constellation Scutum, meaning shield. While the new Ballistic Missile Defense Organization (BMDO) logo contains some obvious changes, most notably the addition of symbols representing the three major services that participate in the ballistic missile defense program, it retains the shield motif to emphasize continuity of mission from SDIO to BMDO.

Capitalizing on the directed energy weapons (DEW) work of the Advanced Research Projects Agency and the Air Force, SDIO pushed back the frontiers of laser development to where it was possible to test a fully integrated laser system. Among SDIO's other DEW accomplishments was the development of mirror coatings that eliminated the need for heavy cooling systems and the advancement of deformable mirrors which astronomers use extensively today.

The SDIO's success in miniaturizing components in virtually all areas of missile defense technology has been fundamental to the progress made over the past ten years. One example of this miniaturization is SDIO's development

of thrusters that weighed little more than eleven pounds yet produced over ten thousand pounds of thrust.

In addition to producing major technological accomplishments, the SDI program played a key role during the Cold War by renewing hope that the U.S. could find an alternative to mutual assured destruction. At the same time SDIO mobilized major elements of the U.S. technology base and focused them on missile defense, a vital area in the superpower rivalry. This caused concern in the Soviet Union, and limiting the SDI program became a central objective of Soviet arms control negotiators.

MISSILE DEFENSE TODAY

The end of the Cold War brought a relaxation of tensions between America and the Soviet Union and reduced concerns about nuclear war. However, a major new threat emerged: the spread of ballistic missile technology and weapons of mass destruction into new parts of the world.

The danger posed by this proliferation prompted a refocusing of SDIO on protecting the U.S. homeland against limited missile attacks and defending theaters against shorter range ballistic missiles. The decision to reorient the U.S. missile defense program was validated by the Gulf War, with its battles between Patriot and Scud missiles.

In keeping with this reorientation, on May 13, 1993, Secretary of Defense Les Aspin changed the name of SDIO to BMDO. SDIO's missile defense technology base became the foundation for the new missile defense program that emerged from a major study of U.S. defense requirements for the post-Cold War era. This study was called the Bottom-Up Review.

Under its new charter, BMDO set out to implement the program prescribed by the Bottom-Up Review and adopted the motto: Making Missile Defense a Reality. An important facet of BMDO's effort was the involvement of DoD's warfighting commands in planning the integration of missile defense systems

into operational units. Another significant feature of BMDO's management approach entailed injecting new technology into currently deployed systems. An example of this philosophy in action is the planned addition of a ballistic missile defense capability to the Navy's AEGIS air defense system.

Among BMDO's greatest achievements is the development of the Extended Range Interceptor (ERINT), the first application of hit-to-kill technology in an operational system. In 1994, the Army selected ERINT as the interceptor to be used in the Patriot Advanced Capability-3 (PAC-3) program. This opened a new page in missile defense history. Prior to ERINT, missile defense interceptors relied on warheads with nuclear or conventional explosives to destroy their targets. The PAC-3 hit-to-kill defense system will be deployed in 1998.

One of BMDO's priorities has been to field improved defenses. Successes in this area include deployments of PAC-2 Guidance Enhanced Missiles (GEM) and U.S. Marine Corps HAWK upgrades.

BMDO's work has also led to significant improvements in our ballistic missile early warning capabilities. Included here are the activation of the Air Force's Attack and Launch Early Reporting to Theater (ALERT) squadron and the Joint Tactical Ground System (JTAGS).

Internationally, a number of programs are underway. The Arrow missile, a joint U.S.-Israeli development intended to defend Israel from ballistic missile attack, has already been successful in a number of test intercepts. Work began in July 1996 on the Medium Extended Air Defense System (MEADS), a partnership between the U.S., Germany and Italy to produce a fully mobile air and missile defense system. The U.S. has also been assisting Japan in the exploration of its own TMD needs.

Finally, work is continuing on the National Missile Defense (NMD) "3+3" program, intended to develop a workable NMD system in three years, with another three years allotted for deployment should that be deemed necessary.

Building on the work of the Services and SDIO, BMDO and its Service and industry partners continue to lead the revolution in missile defense systems and technology.

BMDO TECHNOLOGY MAKES COMMERCIAL SENSE

Many corporations have incorporated BMDO-funded technology - which includes some of the most advanced innovations in the world - into their product lines, giving them the competitive edge in what is now an extremely dynamic international marketplace.

- At least 45 companies have spun off from Federal laboratories, private companies, or universities to commercialize BMDO-funded technology
- Roughly 234 new commercial products have resulted from BMDO-funded technologies
- Fourteen companies funded by the BMDO Small Business Innovation Research program have gone public
- Over 454 ventures have been formed using BMDO-funded technology as a basis
- At least 550 patents have resulted from BMDO funding, with 220 more pending

U.S. BALLISTIC MISSILE DEFENSE PROGRAM FOCUS

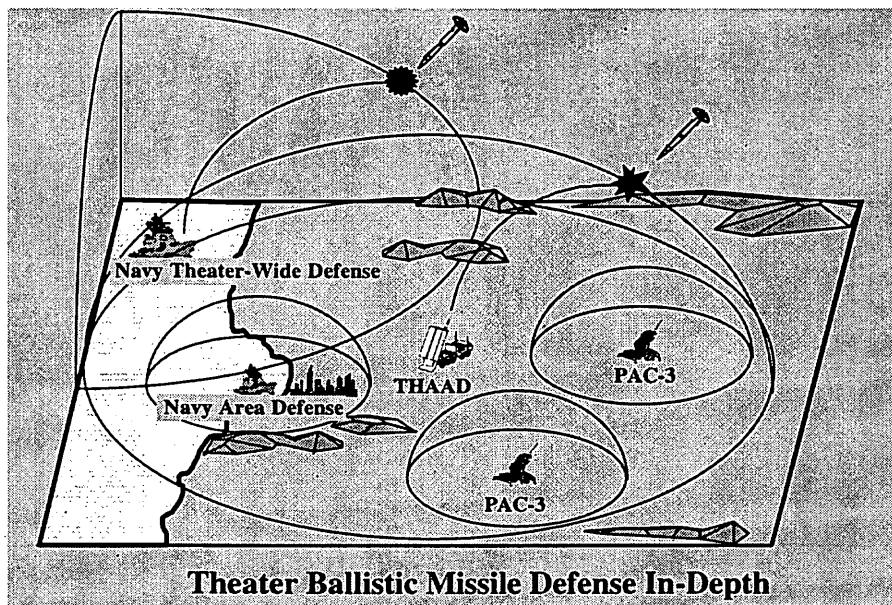

INTRODUCTION

Ballistic missiles have been a threat to the U.S. and its military operations for fifty years. During the Cold War, the strategic balance and deterrence between Soviet and U.S. forces held this threat to our nation's boundaries in check. However, deterrence may not work if ballistic missiles proliferate to rogue states and terrorists. The Gulf War demonstrated the need to protect our troops overseas. The danger is compounded when combined with the spread of weapons of mass destruction. As a result, the U.S. government has determined that proliferation of ballistic missiles is one of the greatest dangers to U.S. national security and global security and will remain so into the foreseeable future.

The Ballistic Missile Defense Organization (BMDO), an agency of the Department of Defense (DoD), is now working to provide active defenses against ballistic missile attacks and to provide a technical base that will allow DoD to hedge against increasingly sophisticated missiles around the world.

PROGRAM AREAS

BMDO has three broad program areas, each addressing a different area of BMDO's mission: Theater Missile Defense, National Missile Defense, and the Support Technology Program. Together, they help ensure that the U.S. can deal with current and future missile threats in an effective and sustainable manner.

Theater Missile Defense

The mission of theater missile defense (TMD) is to protect U.S. forces, allies and other countries, including areas of vital interest to the U.S., from theater missile attacks. The TMD mission includes protection of population centers, fixed civilian and military assets and mobile military units.

TMD concentrates on the immediate ballistic missile threat and has the highest priority of the three programs because this current threat holds the highest risk to U.S. forces.

BMDO is working to develop both land and sea based TMD systems to give our forces the greatest flexibility and provide the most effective TMD.

The TMD arena is divided into an upper and a lower-tier, basically defined by the altitude at which intercept takes place, the speed of the interceptor and the speed of the enemy missile. TMD systems are built to operate best in one tier, although there may be some crossover capability. This allows the systems to best match and negate specific types of missile threats. Moreover, this arrangement gives TMD forces multiple opportunities to destroy an incoming missile as it passes through the tiers.

Lower-tier programs include the Patriot Advanced Capabilities - 3 (PAC-3), the Navy Area Defense, and the Medium Extended Air Defense System (MEADS). The Theater High Altitude Area Defense system (THAAD), Navy Theater-Wide Defense (NTW) and Airborne Boost-Phase Intercept (BPI) comprise our upper-tier development efforts. THAAD, NTW, Navy Area Defense and PAC-3 are TMD Core programs. THAAD, Navy Area Defense and PAC-3 are Major Defense Acquisition Programs (MDAP) while NTW is pre-MDAP. MEADS is an

international program in the Program Definition-Validation Phase and BPI is an Advanced Concept.

National Missile Defense

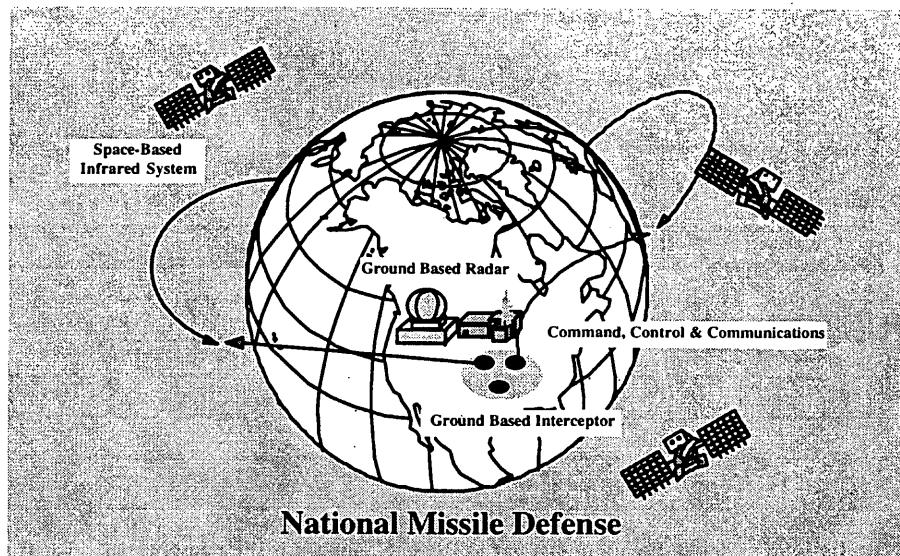

The national missile defense (NMD) program is concerned with the possibility of a limited ballistic missile strike against the U.S. homeland. Although this danger has yet to materialize, many warning signs are now evident. NMD program researchers are developing the technology needed to create a national missile defense system geared to counter a limited threat. The decision to deploy such a system depends on the future threat to the U.S. In light of current threat projections and to stay within technical and financial parameters, NMD program developers are not planning to deploy or develop a comprehensive national missile defense system able to repel a large massed strike.

This "deployment readiness" approach balances the danger of attack against the cost of development, our international treaty obligations, and the possibility of a beneficial technological breakthrough in the future. The NMD program also consists of preparing options for rapid deployment with contemporary technology in case a sudden threat emerges.

The NMD 3+3 program concept is to develop and demonstrate an Intercontinental Ballistic Missile defense system by 1999, continue development thereafter, and if necessary, deploy an initial capability as early as 2003.

NMD System Architecture

The Department of Defense is pursuing a fixed, land-based architecture for the National Missile Defense program. The planned system includes six fundamental building blocks: the Ground-Based Interceptor (GBI); Ground-Based Radar (GBR); Upgraded Early Warning Radars (UEWR); X-band Radars (XBR); Space-Based Infrared System (SBIRS); and Battle Management/Command, Control, and Communications (BM/C3). Depending on the threat if deployment is required, deployment of a NMD system

consisting of these elements might be ABM Treaty-compliant or might require some amendment to the Treaty.

The Support Technology Program

The Support Technology Program supports research on new technologies and provides options for improvement to existing systems. These new ideas include technologies such as the kinetic energy interceptor, advanced surveillance and tracking sensors, and directed energy systems. This program is essential to keep the ballistic missile defense program ahead of the increasingly sophisticated global missile threat.

MISSILE DEFENSE INVESTMENT

Money spent on U.S. missile defense programs over the years has been a worthwhile, sound, and essential investment for the future security of America. The funds used for missile defense have provided the indispensable technology base necessary for deploying several systems designed to protect U.S. forces and allies abroad, while the Department of Defense (DoD) also develops a system that will protect U.S. national territory.

Regardless of this, a question still invariably resurfaces in the United States: "What have the American people received for the estimated \$36 billion spent by the Defense Department on ballistic missile defense (BMD) plans since the program began in 1983?"

**BMDO INVESTMENT FROM 1984-1996
(Dollars in billions)**

STRATEGIC DEFENSE INITIATIVE ORGANIZATION

Americans have benefited from the DoD BMD programs since President Reagan's Strategic Defense Initiative consolidated all Service missile defense programs under one title: the Strategic Defense Initiative Organization (SDIO). Aside from coordinating the Service missile programs, the new organization also brought together the national laboratories and commercial firms working on BMD technology. This saved time and money and also ensured close coordination among all involved.

While SDIO's goal was to deploy eventual missile defenses that could defend America as well as deter the Soviet Union, SDIO first had to develop the technology necessary to produce both ground and space-based sensors and interceptors.

BALLISTIC MISSILE DEFENSE ORGANIZATION

Although there are challenges ahead, a large portion of the development effort has been completed. With the end of the Cold War, the threat caused by the proliferation of ballistic missiles in states hostile to the United States has replaced the Soviet ICBM threat. This does not mean that the United States will no longer face the threat of a ballistic missile attack. Rather, the latest classified National Intelligence Estimate (NIE) clearly states that it is not whether a threat to the United States will exist, but when it will exist.

The Clinton Administration recognized this change in the global environment, renamed SDIO as the Ballistic Missile Defense Organization (BMDO), and re-orientated the missile defense organization to meet today's national security threats. The Department is pursuing a "family of systems" approach to the theater missile challenge. This family of systems will ensure a defense in depth, using multi-tiered defenses against both long and short-range theater class missiles. In general, these programs include the PATRIOT Advanced Capability-3 (PAC-3), Navy Area Defense, Medium Extended Air Defense System (MEADS), Theater High Altitude Area Defense (THAAD), and Navy Theater-Wide Defense systems. The "family of systems" will protect U.S. forces overseas and American friends and allies who count on our support. The DoD also is funding a three-year National Missile Defense (NMD) development program, with an optional deployment of the strategic system three years later.

Americans remember the use of the PATRIOT missile against Saddam Hussein's SCUDS during Desert Storm. A significant improvement to the PATRIOT system is underway; these improvements comprise the new PAC-3 system, just one of the many important missile defense systems being developed. New radars and sensors that are indispensable to deployed future national and theater missile defenses are also currently under development.

APPLICATIONS

Aside from the military use of the ballistic missile defense programs, investments in BMDO has provided technology with commercial applications. Examples of these include: advances in computers and robotics, medicine,

agriculture, weather science, natural resource exploration, and environmental protection, just to name a few. The success of BMDO with dual-use technology application has been tremendous.

CONCLUSION

The estimated \$36 billion dollars spent on U.S. ballistic missile defense programs has been and continues to be a worthwhile, sound, and necessary investment for the future security of the United States. The funds used thus far have provided an indispensable technology base with dual-use applications. They also have given DoD the ability to further develop and field several systems. Though it is difficult to see the success of the missile defense programs without having the products readily in hand, the DoD has been investing wisely in the future security of the United States.

THE INVESTMENT IS MORE THAN MISSILE DEFENSE

BMDO-funded technology developed to protect the United States (from ballistic missile attacks) may likewise be used in other applications to protect families, homes, businesses and the environment.

Leading-edge technology in communications, information systems, sensors, materials and optics may help the law enforcement community do its job better and more safely.

Many U.S. companies are now finding that some of BMDO's technology can help the Nation, as well as other industrialized and developing countries, to solve environmental problems.

While improving the Nation's defense, much of BMDO's technology also offers strategic benefits to the American manufacturing community, helping companies significantly improve industrial capability.

BALLISTIC MISSILES AND THE WORLD SECURITY ENVIRONMENT

The Ballistic Missile Defense Organization (BMDO) is a consumer, not a producer, of intelligence analyses on missile threats. However, as the central Department of Defense (DoD) manager and integrator of the ballistic missile defense (BMD) mission, with the Director acting as the Department's BMD Acquisition Executive, BMDO has a keen interest in missile threat developments.

A large number and expanding variety of offensive missile systems are found in the military arsenals of several nations. Many are imported, some are domestically developed and a few are indigenously modified. The threat includes tens of countries armed with ballistic missiles, hundreds of missile launchers and thousands of missiles with ranges from 30 to greater than 3,000 kilometers. All are lethal weapons of modern warfare and currently pose a threat that is largely regional in character. However, the trend is clearly in the direction of systems of increasing range, lethality, accuracy and sophistication.

Ballistic missiles are appealing weapons for developing nations and often serve as status symbols. Their long range, short flight time, relatively low cost and ability to carry a variety of warheads provide unique political as well as military advantages. In addition, defenses against ballistic missiles are not as mature or widely deployed as defenses against aircraft or other delivery systems.

DEVELOPING COUNTRIES AND BALLISTIC MISSILES

There are over a dozen families of ballistic missiles in developing nations. This worldwide proliferation has caused the U.S. to strengthen nonproliferation regimes and to develop defenses against offensive missiles.

*In Development or Testing

The importance of ballistic missile defense (BMD) is underscored by the growing proliferation of weapons of mass destruction (nuclear, chemical and biological weapons). The nuclear club has more than doubled in the past 20 years. Currently 13 nations possess nuclear weapons and several other nations either have the ability to develop nuclear weapons or have active nuclear weapons programs. Chemical weapons have been dubbed "the poor man's atomic bomb" and are viewed as an attractive and affordable alternative to nuclear weapons by many developing nations. Sixteen developing nations have chemical weapons programs. Eleven developing nations have biological weapons research programs, although they are harder to develop and maintain than chemical weapons.

An example of the growing sophistication of Third World ballistic missile developments are the long-range missiles under development in North Korea. One missile, the No Dong, was tested in 1994 and may be capable of carrying nuclear, chemical or biological weapons. Reportedly, the North Koreans are developing two additional missiles, the Taep'o Dong 1 and 2, with ranges greater than the 1,000 km No Dong.

In July 1995 and again in March 1996, China conducted tests of its DF-15 and DF-21 short and medium range ballistic missiles off the coast of Taiwan, at times as close as 20 miles from the Taiwanese coast.

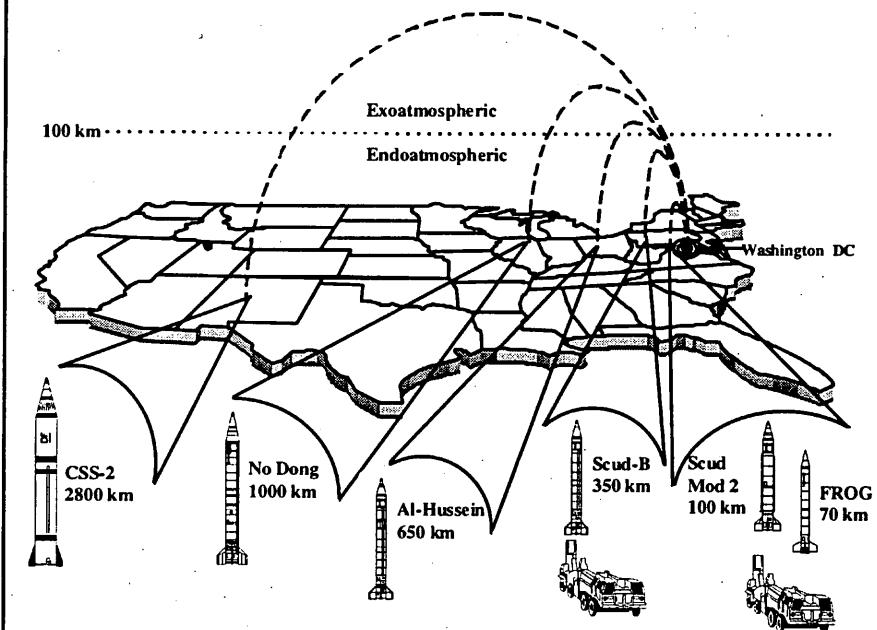

Only Republics of the Former Soviet Union and China today possess missiles capable of directly threatening the U.S. While both countries continue to modernize their ballistic missile forces, the U.S. intelligence community has assessed a deliberate or accidental/ unauthorized attack by Russia or China on the U.S. as highly unlikely.

While no hostile nation currently possesses the capability to threaten the U.S. with ballistic missiles, the possibility of a limited, long-range ballistic missile threat from the Third World sometime in the not-too-distant future cannot be excluded.

BALLISTIC MISSILE USE IN REGIONAL CONFLICT

THE BALLISTIC MISSILE DEFENSE FISCAL YEAR 1997 BUDGET

INTRODUCTION

....Finally, and importantly, the committee sought to accelerate development and deployment of missile defense systems to protect U.S. and allied forces against the growing threat of cruise and ballistic missiles. Accordingly, this bill supports expeditious deployment of land- and sea-based theater missile defense systems."

—National Defense Authorization Act for Fiscal Year 1997

The Ballistic Missile Defense Organization's (BMDO) budget is structured to respond to existing and emerging ballistic missile threats to the United States, and its forward deployed forces, allies, and friends around the world. First priority is Theater Missile Defense (TMD), second priority is National Missile Defense (NMD) and, third priority is an investment in BMD advanced technology in order to enhance future BMD capabilities for both TMD and NMD.

BUDGET AND ACQUISITION MANAGEMENT

The Department of Defense (DoD) has three major steps to help manage the budgeting and acquisition process: Requirements Generation; Planning, Programming, and Budgeting; and Acquisition Management.

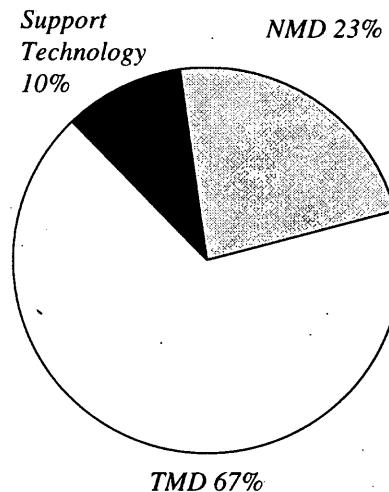

Requirements Generation involves identifying needs in broad terms and progressively narrowing these down into specific system features. An example might be the need to quickly respond to a new threat, such as a new weapons system. Acquisition Management filters the various design concepts of systems that could respond to this new threat, and ultimately results in a stable system design that meets user's needs. Finally, the Planning, Programming and Budgeting phase determines whether the system will be affordable in relation to the overall budget and other demands. The DoD uses these steps to balance the increasing need for missile defense with the constant necessity for fiscal prudence.

BUDGET STRUCTURE

The BMDO's budget is divided between two basic activities: research, development, testing and evaluation (RDT&E) and military construction (MILCON). Prior to fiscal year 1998, procurement was also part of the BMDO budget. Now it is funded by the Services.

The RDT&E budget represents all the work done to create new systems such as weapons, sensors, or computers. This includes basic research on advanced concepts and designing, engineering, or testing prototypes. RDT&E comprises the vast majority of the BMDO's budget, and many well known projects are currently in this stage. In fact, some of the BMDO's most prominent programs, such as National Missile Defense, Theater High Altitude Area

FY97 APPROPRIATION % of BMDO BUDGET

Defense (THAAD), Patriot Advanced Capability-3 (PAC-3), Navy Area-wide, Navy Theater-wide, and the Medium Extended Air Defense System (MEADS), are considered part of RDT&E.

MILCON represents the money spent to construct and maintain buildings, testing sites, and other facilities that the BMDO may need for RDT&E or any other support activities.

Every year, in February, the President submits his fiscal year budget to Congress. Included in the overall budget request is funding for BMDO. After receiving the President's budget, Congress reviews the government programs and policies, sets limits, and provides the funds and guidance to carry out programs and policies. After Congress completes action, the legislation is forwarded to the President for signature.

PROGRAM AREAS

BMDO has three broad program areas, each addressing a different area of BMDO's mission: Theater Missile Defense (TMD), National Missile Defense (NMD), and the Support Technology Program. Together, they help ensure that the U.S. can deal with missile threats in an effective and sustainable manner.

The TMD mission is to protect U.S. forces, allies and other countries, including areas of vital interest to the U.S., from theater missile attacks. The TMD mission includes protection of population centers, fixed civilian and military assets and mobile military units.

The NMD program addresses the possibility of a limited ballistic missile strike or accidental launch against the U.S.
